

What is Laser Therapy?

Laser therapy utilizes various wavelengths of light to stimulate the natural healing power of the body. By using light to stimulate cells, the laser can improve healing time, increase circulation, and decrease swelling which will decrease pain. In many cases the patient will exhibit renewed energy and range of motion. Long term pharmaceutical use and surgical treatment may be reduced or eliminated with laser therapy.

Treatment Recommendations

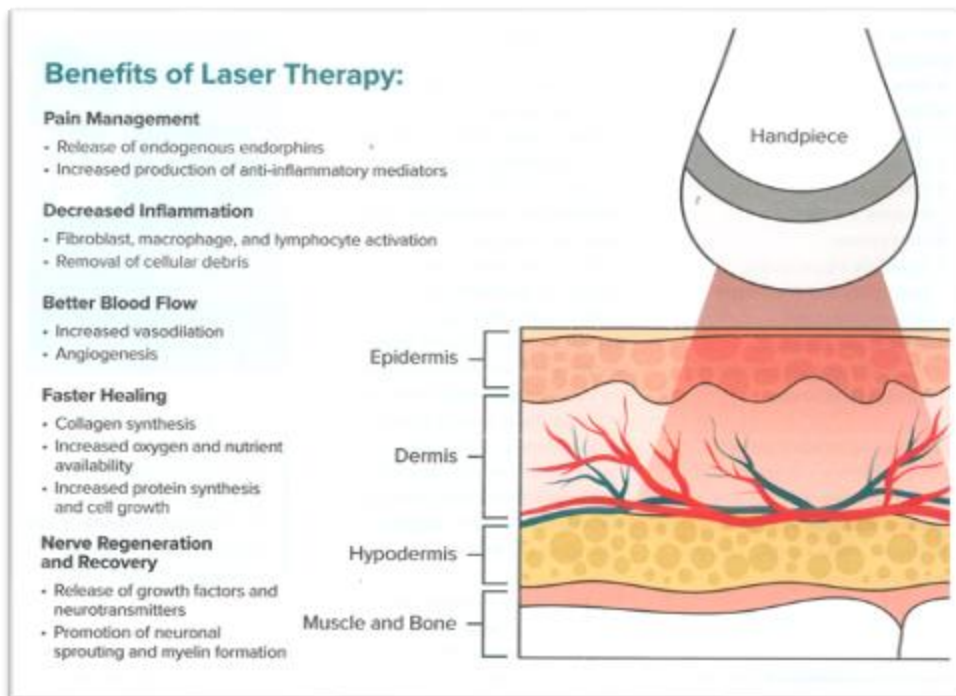

The veterinarian will recommend a treatment plan and subsequent treatments will be performed by trained veterinary personnel. Most pets find the treatment pleasurable and do not require sedation or restraint. Most conditions require a multi-visit treatment plan. Our veterinarians suggest the following treatment plan:

- Twice weekly for three weeks

OR

- Three times weekly for week 1, Twice weekly for week 2, then once for week 3
- Follow up Treatments as needed

Talk to one of our assistants or technicians today! We offer laser treatment packages for your convenience and to save on total cost.
